### Minnesota Population Projections 2005-2035

*Minnesota Population Projections 2005-2035* was prepared by Martha McMurry of the Minnesota State Demographic Center.

Upon request, this report will be made available in alternate format, such as Braille, large print or audio tape. For TTY, contact Minnesota Relay Service at 800-627-3529 and ask for the State Demographic Center.

June 2007

For additional copies of this report or other population information, contact the State Demographic Center helpline at (651) 296-2557.

# MINNESOTA POPULATION PROJECTIONS 2005-2035

Minnesota's population is projected to grow to 5,709,700 by 2015 and 6,446,300 by 2035. These population gains will be driven by both natural increase – more births than deaths – and by net in-migration – more people

moving in than moving out.

The Twin Cities suburbs and the Rochester and St. Cloud regions are all expected to see substantial growth over the next 30 years. The lakes area of north central Minnesota is also projected to have a

**From 2005 to 2035, fastest growth in Minnesota will be for ages over 65**

Projected change in number

Numbers are rounded

**From 2005 to 2015, fastest growth in Minnesota will be for ages 55 to 69**

Projected change in number

Minnesota State Demographic Center projections  
Numbers are rounded

considerable increase. Slow growth or decline is projected in much of western Minnesota and in the core counties of the Twin Cities.

## Population is aging rapidly

The continued aging of the baby boom will produce an explosion in the number of people ages 55 to 69 during the coming decade. Over the longer term, between now and 2035, the population over age 65 will more than double, from

623,200 in 2005 to 1,400,000 in 2035. By contrast, the population under age 65 will grow only 10 percent.

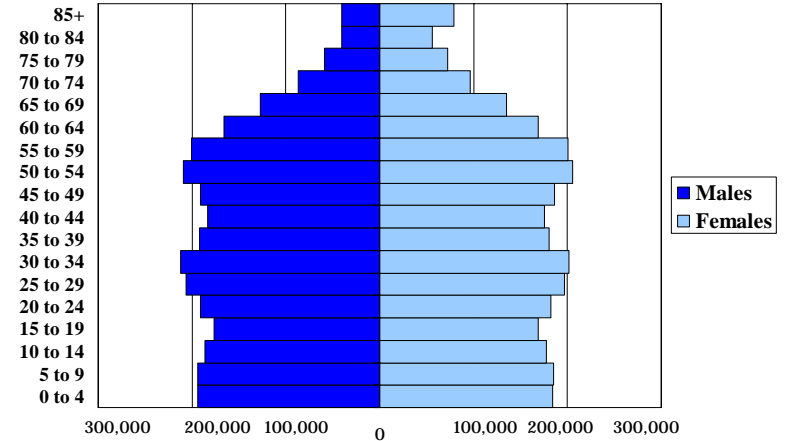

The statewide projections shown in this report are similar to those published in 2002. The modified 2005 population estimate used as a starting point in this series is close to the number projected for 2005 in the earlier series. (See <http://www.demography.state.mn.us/DownloadFiles/ooProj/PopulationProjections 02.pdf>.)

Minnesota's population in 2005 by age and gender

U.S. Census Bureau estimates modified by Minnesota State Demographic Center

Minnesota's population in 2015 by age and gender

Minnesota State Demographic Center projections

Minnesota's population in 2035 by age and gender

Minnesota State Demographic Center projections

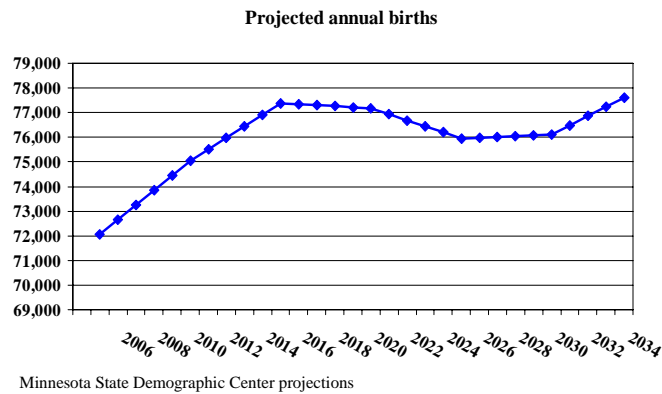

Figures for individual counties and age groups are often significantly different from the 2005 projections series, however.

**Births and deaths both will rise**

Births are projected to rise steadily between now and 2015. Births will be at their highest levels since the baby boom era of the 1960s, with more than 77,000 births by

2015. After 2015, births are projected to fluctuate within a narrow range, remaining well above the levels of the 1990s. Birth rates by age are projected to remain constant, so the increase in births is attributable to anticipated growth in the population of women of child-bearing age. The number of women 20 to 34, the age when they are most likely to have children, is expected to rise 10 percent during the coming decade.

**Minnesota births projected to rise in the coming decade**

Deaths will also increase. The number of deaths will rise from about 190,000 between 2005 and 2010 to 250,000 between 2030 and 2035. Though people are expected to live longer, the number of deaths will rise as the size of the population increases and the number of older people grows rapidly.

**Natural increase will account for four-fifths of all growth**

Natural increase, the excess of births over deaths, is projected to account for about 80 percent of all population growth over the next 30 years. Natural increase will peak between 2010 and 2015 and then decline as the number of deaths goes up.

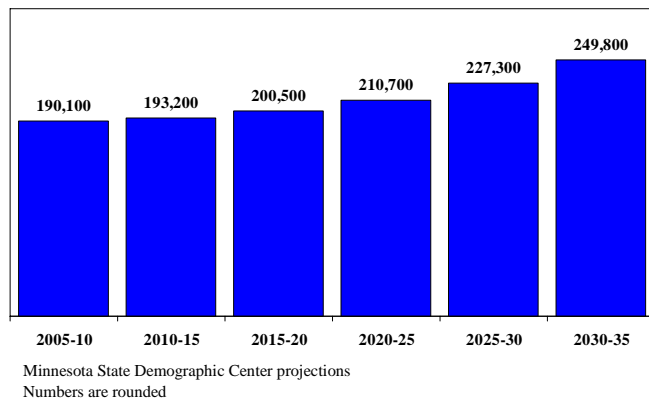

Migration is also expected to contribute to population growth, accounting for about 20 percent of total population growth in coming decades. Net in-migration is projected to taper off from about 80,000 between 2005 and 2010 to 16,000 between 2030 and 2035. A shift to higher in-migration or to out-migration is, of course, always possible

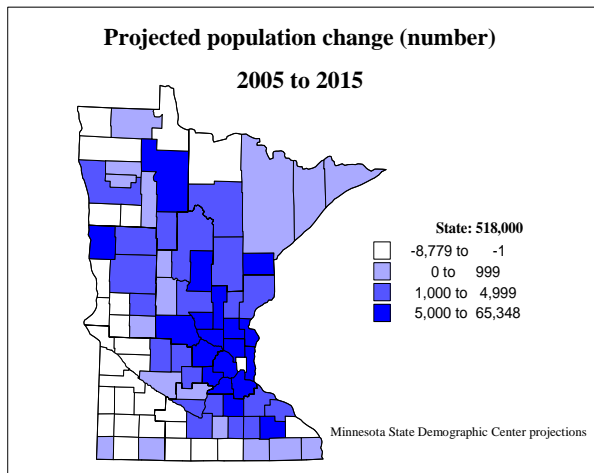

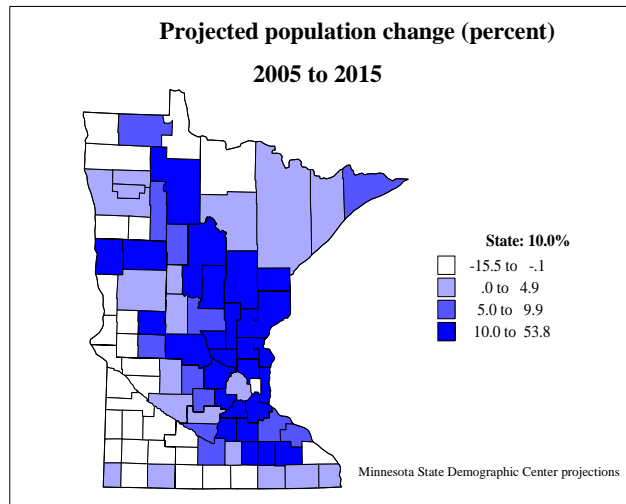

and would have a substantial impact on future population.

**2005 to 2015 growth expected to be substantial**

Between 2005 and 2015, Minnesota’s population is projected to grow by 518,000, or about 10 percent. This growth rate is similar to that of the past 15 years. The most rapid gains will occur in suburbs in the Minneapolis-St. Paul region, including Scott (54 percent), Wright (52 percent), and Sherburne (44 percent) counties. Scott County is projected to add the largest number of new residents (65,000), followed by Dakota (49,000) and Wright (47,000) counties. Twenty-eight counties, mostly in western Minnesota, are projected to lose population during the coming decade.

**Number of Minnesota deaths is projected to rise**

**Minnesota population projected to grow 24 percent from 2005 to 2035**

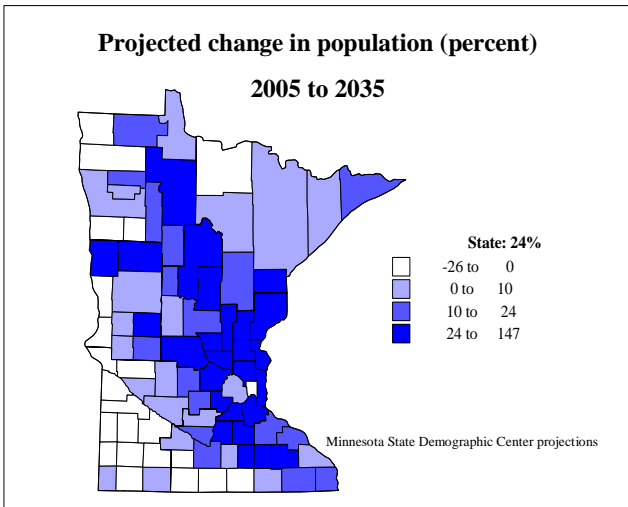

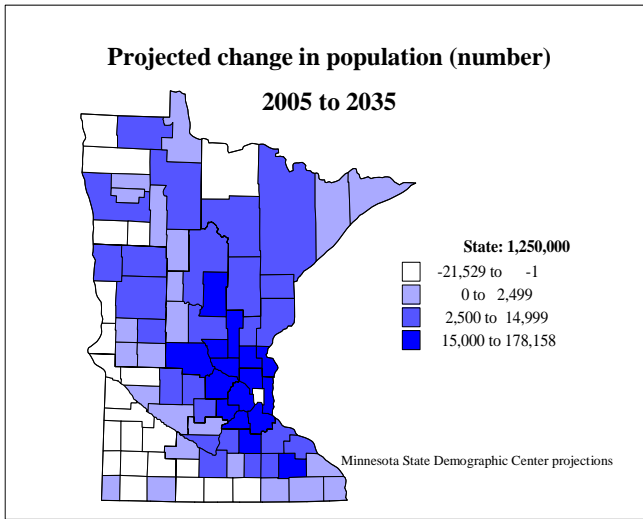

Minnesota’s population is projected to pass the 6 million mark by 2025 and to reach 6.45 million by 2035. This represents a gain of 24 percent, or about 1.25 million people in 30 years. The fastest rate of growth is projected for Scott County (147 percent), followed by Wright (116 percent), and Sherburne (112 percent) counties. The largest numerical gains will occur in Scott, Wright, and Dakota counties. Twenty-three counties are projected to experience declining population.

Over the 30-year period, metropolitan areas are projected to grow almost twice as fast as nonmetropolitan areas, 28 percent compared to 15 percent. About 83 percent of all growth will occur in metropolitan areas. The seven-county Twin Cities area will account for about 46 percent of all growth over the three decades and the four suburban

ring counties – Chisago, Isanti, Sherburne, and Wright – will contribute about a quarter of the gain.

**Population 0 to 14 will increase**

The number of children under age 15 is projected to grow slightly over the next 25 years. There will be about 9 percent more children in 2015 than there are now. After a period of declining school enrollments statewide, educators in many areas can anticipate that enrollments will increase or at least remain stable. Most of the gain in the child population will occur in counties that attract young families, particularly in the Twin Cities suburbs. The number of children is expected to grow 50 percent in Scott County and 48 percent in Wright County. The child population is expected to decline in Ramsey County and show little change in Hennepin County. Other areas with slow-growing child populations will be southwestern and northeastern Minnesota.

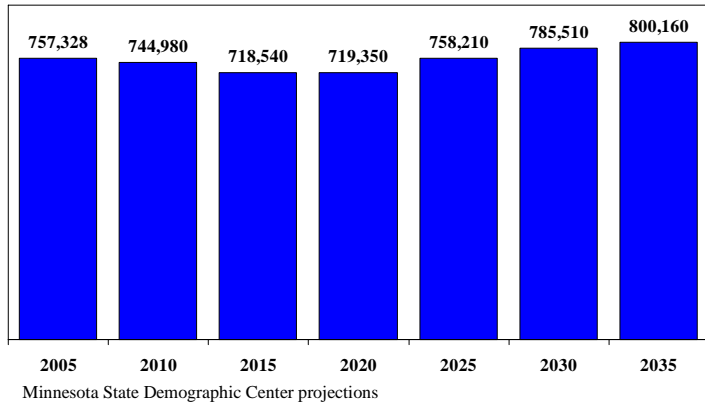

After 2015, the statewide child population is projected to remain stable, but geographic variation will be large. While the number of children in suburban areas will continue to grow, many rural areas will show substantial declines in their child population.

decline about 5 percent during the coming decade but then rise again between 2015 and 2035. There will be about 6 percent more young adults in 2035 than there were in 2005, the projections show.

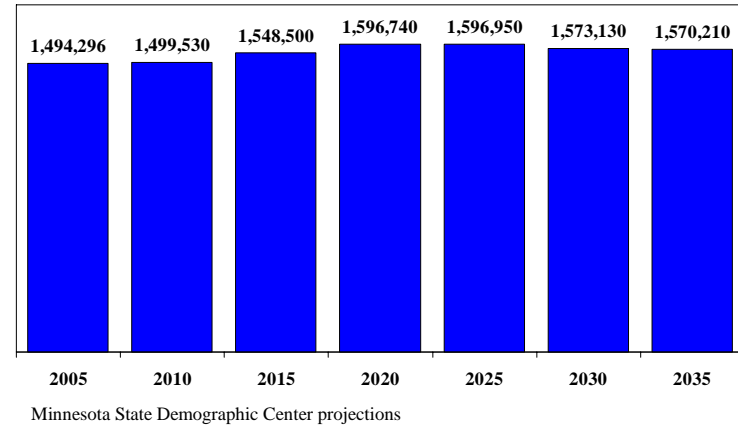

**Population ages 15 to 24 will fall, then rise after 2015**

The number of Minnesota young adults ages 15 to 24 will

**Projected Minnesota population ages 15 to 24**

**Projected Minnesota population ages 25 to 44**

**Population 25 to 44 will be stable**

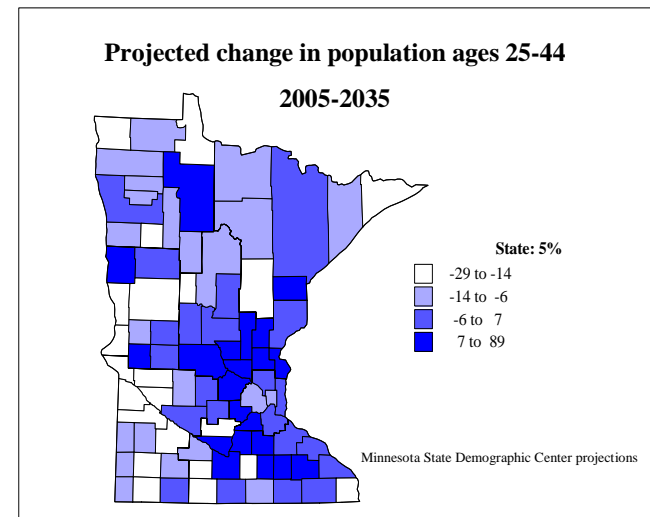

The number of Minnesotans ages 25 to 44 will not change much. The population in this age group will grow about 4 percent between 2005 and 2015 and then remain stable. Most of the gains will occur in metropolitan areas.

**Population 45 to 64 will increase sharply this decade**

As the baby boom continues to age, the number of Minnesotans ages 45 to 64 will grow

significantly in the coming decade. Between 2005 and 2015, the number of people in this age bracket is expected to grow by almost 240,000, or about 19 percent. The 45- to 64-year-old age group will account for almost half of total population growth. The largest percentage gains are projected for suburban counties such as Scott, Sherburne, Carver, Chisago, and Wright. The largest numerical gains are expected in Hennepin, Dakota and Anoka counties.

**Projected change in population ages 25-44 2005-2035**

**Projected Minnesota population ages 45 to 64**

**Projected change in population ages 45-64  
2005-2035**

After 2015, the baby boomers will be moving out of this age bracket and the size will decline slightly as the boomers are replaced by the smaller baby bust generation.

**Population 65+ will soar**

The number of Minnesotans age 65 and older will explode in coming decades. The number of older Minnesotans will grow by 27 percent, or 169,000 between 2005 and 2015. Between 2005 and 2035, the population of older Minnesotans will go up 125 percent, or almost 770,000. More than half the population growth in the next 30 years will be attributable to gains in the older population.

Because the older age groups will grow so much faster than the younger age groups, the age composition will change. In 2005, about 12 percent of the population was 65 or older. This will grow to 14 percent by 2015; by 2035, 22 percent of the population will be 65 or older.

During the coming decade, the biggest numerical gains in the elderly population will occur in Hennepin, Dakota, Anoka and Washington counties. The highest rates of growth will occur in suburban counties such as Scott (95 percent), Sherburne (85 percent) and Washington (78 percent). Despite the surge in the statewide older population, some rural counties will see a decline in the number of elderly people, reflecting out-migration of adults in the past.

Over the 30-year period covered by these projections, the older population will show dramatic rates of growth in the Twin Cities suburban counties. The numbers of elderly residents in Scott, Sherburne, Carver and Wright counties will more than quadruple between 2005 and 2035. Most of this gain will be due to the aging in place of people who moved there as young or middle-aged adults.

**Projected Minnesota population ages 65+**

**Percent of population ages 65+**

**Projected change in 65+ year-old population**

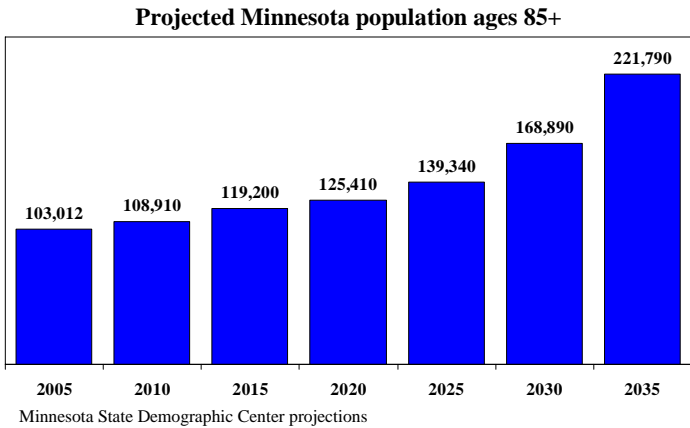

The age composition of all parts of the state will be much older in 2035 than it is now. In 2005, the elderly population made up 20 percent or more of the population in 16 counties. By 2035, 73 counties will have more than one in five residents who are 65 or older, and in 21 counties at least 30 percent of the residents will be 65 or older. Though suburban counties will experience large growth in their older populations, they will remain

younger than other areas because they will continue to attract younger residents.

**Suburban counties will see surge in 85+ populations**

The 85 and older population is projected to grow 16 percent this decade and 115 percent between 2005 and 2035. The number of very old Minnesotans will surge after 2025 as people born during World War II and the baby boomer era begin to pass their 85th birthdays. Greater

longevity will also play a part in explaining the gains in this age group.

Suburban counties will see the most rapid expansion in the number of people ages 85 and over. Between 2005 and 2035, the number is expected to more than quadruple in Scott, Sherburne, Washington, Wright, Isanti, Anoka and Dakota Counties. Western Minnesota counties will see

much smaller gains in their very old populations.

**METHODOLOGY**

The population projections presented in this publication were prepared using the cohort-component method. Modified 2005 U.S. Census Bureau population estimates by age and gender were used as the starting point. Assumptions were then made about the rates

of mortality, fertility and migration during each five-year period. The population at the end of each time period reflects the expected number of survivors, births during the period, and additions or subtractions attributable to migration. The projected population then becomes the basis for the next cycle of projections calculations.

County projections in each age-sex group were controlled to the state totals. Regional and metropolitan area projections were derived by adding up the counties in the region or metropolitan area.

Metropolitan area definitions are those established in 2005 by the federal Office of Management and Budget . (See:

[http://www.whitehouse.gov/omb/bulletins/fy2006/b06-01\\_rev\\_2.pdf](http://www.whitehouse.gov/omb/bulletins/fy2006/b06-01_rev_2.pdf).)

### **Baseline 2005 population**

A modified version of the 2005 Census Bureau population estimates by age and gender was used as the starting point for the projections. (See

<http://www.census.gov/popest/counties/asrh/CC-EST2005-alldata.html>.) The Census estimates for ages 0 to 14 and 25 to 49 were raised. The 0- to 4-year-old population was increased by 1.5 percent, the 5 to 14 population by 2.5 percent and the 25 to 49-year-old population by 2.0 percent. The increases were based on trends in school enrollment and birth data that suggest the Census Bureau 2005 estimates may be low for the school-age and pre-school populations. Since the number of children was increased, the number of adults in the major parenting age groups was also raised. The increases were applied uniformly across counties.

As a result of the adjustments, the baseline population does not match numbers from any estimate series. The 2005 state population estimate used here, 5,192,122, is higher than the Census Bureau estimate of 5,132,122 (based on the 2005 age estimates) or 5,126,739 (based on the state total estimates published at <http://www.census.gov/popest/>

[states/NST-ann-est.html](http://www.census.gov/popest/states/NST-ann-est.html)). It is slightly lower than the state estimate based on the Minnesota State Demographic Center/Metropolitan Council figures, 5,205,091. County totals also differ from the U.S. Census Bureau or State Demographic Center/Metropolitan Council figures.

### **Mortality assumptions**

Survival rates were assumed to be the same in the state and all of its counties. The projections assume that survival rates will increase at the same rate assumed in the 2002 State Demographic Center projections report. These increases were based on assumptions in national projections prepared by the U.S. Census Bureau. The national changes in survival rates were applied to 2004 Minnesota survival rates. The 2004 survival rates were based on a life table calculated using a 3-year average of mortality rates by age. In 2004, Minnesota's life expectancy was above the national average,

and this difference is expected to continue. Most improvement in survival rates is projected to occur at older ages, since mortality among younger age groups is already very low. Survival rates are expected to rise more for males than for females, continuing an established trend.

### **Fertility assumptions**

Fertility rates by age and county were projected to remain constant at 2004 levels. Using an average of births from 2003 through 2005, the Minnesota total fertility rate was 2.03. County total fertility rates range from a low of 1.55 in Cook County to a high of 3.22 in Mahnommen County. (See *Population Notes*, December 2006.)

### **Migration assumptions**

Migration rates were assumed to vary by age, sex and county as well as over time. In-migration and out-migration were projected separately. Net migration was calculated by subtracting out-migration from in-migration.

Data on in- and out-migration by age between 2000 and 2005 is not available. Migration numbers were estimated by using the 2000 Census data on in- and out-migration between 1995 and 2000. The 1995 to 2000 numbers were then updated to 2000 to 2005 using an estimate of total 2000 to 2005 net migration and an adjustment procedure described by Smith, Tayman and Swanson in the 2001 publication *State and Local Population Projections*. Total net migration from 2000 to 2005 was estimated by subtracting natural increase – births minus deaths – from total population change, the difference between the adjusted 2005 Census Bureau population estimate and the 2000 Census estimate for July 1, 2000. The Smith, Tayman and Swanson adjustment method uses the 2000 to 2005 total net migration estimate as a control and assumes the age profile of in- and out-migrants remained the same as in 1995 to 2000. If there is more net in-migration between 2000 and

2005 than between 1995 and 2000, the number of in-migrants in each age group will go up and the number of out-migrants will go down. If net in-migration has decreased since 2000, the number of in-migrants in each age group is lowered and the number of out-migrants is raised.

The out-migration numbers were further adjusted for emigration from the United States. Out-migration from the U.S. is not measured in the 1995 to 2000 migration data. The projections assume that international out-migration is equal to 25 percent of the number of international in-migrants. Total out-migration was estimated by adding the estimated number of emigrants to the number of out-migrants to other counties.

Once the adjusted numbers of in- and out-migrants were estimated, new in- and out-migration rates were calculated. The baseline in-migration rate for each county was based on dividing the number of in-migrants by the

total 2000 U.S. population in the denominator age-sex group minus the age-sex group population in the county. The age group used for the denominator is 5 years younger than the migration age. For example, the number of in-migrants in the 10- to 14-year-old group is divided by the migrant pool ages 5 to 9. The U.S. population estimates are for July 1, 2000 and come from the U.S. Bureau of the Census at <http://www.census.gov/popest/national/asrh/files/NC-EST2005-ALLDATA-R-File02.txt>. The baseline 2000-2005 out-migration rate for each age/gender group is estimated by dividing the number of out-migrants by the population in the next younger age group in 2000. For example, the out-migration rate for males 10 to 14 is calculated by dividing the number of 10- to 14-year-old out-migrants from 2000 to 2005 by the 5- to 9-year-old population in 2000. The U.S. Census Bureau July 1, 2000, county population estimates were used for the

denominator. (See <http://www.census.gov/popest/counties/asrh/files/cc-est2005-grace-27.csv>.)

The procedures used to obtain in- and out-migration rates for counties were also used to calculate rates for the state. For all areas, male and female in- and out-migration rates were averaged for children ages 0 to 14 and for adults ages 70 and over.

For projections of future migration, the out-migrant pool was the 2005 adjusted population estimate or the projected population of the state or county in the age-gender group. The in-migrant pool was the estimated or projected United States population minus the state or county estimate or projection. The national projections come from <http://www.census.gov/ipc/www/usinterimproj/>.

The projections assume that Minnesota will experience modest in-migration in coming decades but that this will taper off over time as the national

population continues its long-term shift to western and Sunbelt states. In-migration was reduced by multiplying the following values times the 2000-2005 rates: 2005-2010, .93; 2010-2015, .93; 2015-2020, .88; 2020-2025, .84; 2025-2030, .81; 2030-2035, .80. Out-migration rates were increased by the following ratios during these same periods: 1.015, 1.015, 1.025, 1.050, 1.050, 1.050.

Counties were divided into six categories with varying migration rate adjustments. The first group included six rapidly growing suburban counties – Carver, Chisago, Isanti, Scott, Sherburne and Wright. The in-migration multipliers in this group were 1.015, 1.015, 1.010, 1.010, 1.005 and 1.005. The out-migration multipliers were .990, .990, .995, .995, .995 and .995.

The second group included four core counties in the

Minneapolis-St. Paul area – Anoka, Dakota, Hennepin and Ramsey. For these counties, in-migration was reduced by the following ratios: .940, .940, .890, .850, .830 and .810. Out-migration was increased by ratios of 1.015, 1.015, 1.025, 1.050, 1.050 and 1.050.

For Washington County the in-migration multipliers were .960, .960, .940, .940, .920 and .900. The out-migration multipliers were 1.000, 1.000, 1.002, 1.002, 1.003 and 1.003.

The fourth group of counties included the regional centers of St. Cloud and Rochester and their suburbs and emerging suburbs of the Twin Cities – Benton, Dodge, Goodhue, LeSueur, McLeod, Mille Lacs, Olmsted, Rice and Stearns counties. In-migration in these counties was decreased using the following ratios: .960, .960, .910, .870, .850 and .830. Out-migration was increased by ratios of 1.010, 1.010, 1.015, 1.025, 1.025 and 1.025.

The fifth group of counties includes those in the Mankato and Owatonna areas – Blue Earth, Nicollet and Steele. The in-migration ratios in these counties were .960, .960, .900, .860, .840 and .820. The out-migration ratios were 1.012, 1.012, 1.020, 1.035, 1.035 and 1.035.

In all remaining counties, the migration ratios were the same as for the state. A final adjustment was made to the Swift County population, where the prison population affects the migration rates for adult males. At each future time period, the male population in each age group 20 to 54 was calculated by adding the male-female difference in 2005 to the projected female population. In addition, the female out-migration rates in Swift County were adjusted downward.
